

CRACK SEALING TECH TIPS

KNOW BEFORE YOU GO

- ✗ Do not crack seal if there is any salt in the cracks. Salt acts like a bond breaker and will cause the crack sealant to fail.
- ✗ Do not crack seal if de-icing salt solutions have been applied over the course of the winter. Instead, wait until the site has experienced one or two ample rainfalls to wash away any residue.
- ✓ Do contact your local GemSeal representative for help in choosing the right crack sealant for your job.
- ✓ Our cold-pour crack sealing and filling products are available in trowelable or pourable application. Cold-pour options are ideal for smaller or isolated areas of pavement cracking.
- ✓ Our hot-applied crack sealant products have been engineered for quick and easy application over large parking areas, highways, city streets, and airports. They are ideal for areas with heavy foot and vehicle traffic as well as specific temperature ranges. May be used with oil-jacketed and direct-fire melters.
